To Do's

- either make framework work or create new framework
- analyze locks in lecture slides and in paper:
 - – Test-and-Set Lock
 - Test-and-Test-and-Set Lock
 - Ticket Lock
 - Array Lock
 - CLH Lock
 - MCS Lock
 - Hemlock (from paper..)
- in the lectureslides from the project it says:
 - – Benchmark the following two under various scenarios, meaning low/high contention
 - Benchmark Throughput (probably locks-unlocks performed per time)
 - Benchmark Latency
 - Benchmark for fairness, we have to think of some number to measure fairness, maybe lock-s/unlocks achieved per thread
